

India Crime Intelligence Dashboard (2001–2013)

Professional Project Report

Project Overview

This end-to-end Business Intelligence project analyzes Indian crime data (2001–2013) using Microsoft Excel and Power BI. It covers data cleaning, transformation, DAX calculations, KPI creation and interactive dashboards.

Business Problem

Transform raw crime records into actionable insights for state, district and crime-category analysis.

Objectives

Analyze national trends, identify hotspots, study crimes against women, compare crime categories, perform YoY analysis and build interactive dashboards.

Tools

Microsoft Excel, Power BI, Power Query, DAX.

Data Preparation

Removed duplicates, standardized state/district names, removed aggregate rows, validated data and prepared the model for Power BI.

Dashboard Pages

1. National Crime Overview
2. Women Crime Intelligence
3. State Crime Intelligence
4. District Crime Intelligence

Insert the four dashboard screenshots at the appropriate sections before sharing publicly.

Power BI Features

Dynamic KPIs, DAX measures, YoY analysis, slicers, drill-through, navigation buttons, maps, heatmaps, conditional formatting and interactive tooltips.

Key Insights

Maharashtra records the highest overall crime volume; theft is the largest crime category; crimes against women increased over the study period; 2013 recorded the highest overall crime volume; district-level analysis identifies major crime hotspots.

Recommendations

Strengthen law enforcement in high-crime regions, enhance women safety initiatives, monitor YoY growth, and allocate resources using dashboard insights.

Business Outcome

The project demonstrates practical Business Intelligence skills by converting raw crime data into interactive, decision-ready dashboards.
